

Put AI where it belongs.

Most teams start with a tool. Start with the work instead. Sort every task into one of three lanes, then automate from the top down.

1

Automate

Repetitive, rule-based work that happens every day

2

Assist

AI drafts, sorts or suggests; a person checks and decides

3

Keep human

Judgement, trust and relationships

STEP 1 · SORT THE WORK

Three questions for every task

List the tasks your team repeats each week. Run each one through these questions, top to bottom.

Does it follow the same steps every time?

Could you write the rules on one page?

Yes →

Automate

No ↓

Would a good first draft save real time?

Emails, summaries, research, replies

Yes →

Assist

No ↓

Does it need judgement, trust or a relationship?

Pricing, hiring, hard conversations

Yes →

Keep human

Rule of thumb: if a mistake would reach a client, keep a person approving it, even when AI does the work.

STEP 2 · START SMALL

Your first 30 days

- Week 1

Map

List every repeated task. Sort each into Automate, Assist or Keep human. No tools yet.
- Week 2

Pick one

Choose the Automate task that happens most often and annoys people most. Just one.
- Week 3

Build

Automate it end to end, with a person approving anything that reaches a client.
- Week 4

Measure

Compare time spent before and after. Keep what works, then pick the next task.

Not sure which task to start with?

I'll look at your workflows and show you what I'd automate first.
